Also disclosed are PFM PR and PFM zinc finger (ZF) domains, and the polynucleotide sequences encoding them. The invention also discloses PFM cligonucleotides and methods for detecting a PFM polynucleotide sequence in a sample. The PFM polypeptide and polynucleotide sequences are useful for preparing a composition for modulating cell growth for treating cancer or diseases of cell degeneration, e.g. as Alzheimer's disease, parkinson's disease or insulin-dependent diabetes mellitus (IDDM). The present sequence represents a primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New PR Family Member 2 oligonucleotide, useful for preparing a composition for modulating cell growth for treating cancer or discell degeneration, e.g., Alzheimer's disease or insulin-dependent diabetes mellitus.

The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele CC specific inhibitor (ASI) trargeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal somatic CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the CC used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC malignant cells from bone marrow transplants. used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polygetic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-C26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         \frac{\partial f}{\partial x}. Identifying target genes for allele-specific drugs – used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
The present invention relates to an oligonuclectide array comprising oligonuclectide tags fixed to a solid substrate. The oligonuclectide array is useful for genotyping a nucleic acid sample at one or more larray is useful for genotyping a nucleic acid sample at one or more lavia single base extension (SBE) reactions. A pair of primers is used amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one such polymorphic locu

The amplified nucleic acid product is used as a template in a SBE reaction with an extension primer. The seaction products are used to form the oligonucleotide array. Note: sequence includes a SNP represented by the degenerate codon in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human CC interleukin 6 gene untranslated sequence contg. a purine rich sequence CC concd. on one strand of the duplex. The oligomer, and others like it are CC useful in diagnosis and therapy of diseases characterised by specific DNA CC duplex targets, e.g. HPV, HER, HTV, hepatitis B, herpes, malignant CC thmours and inflammation. The triple helices form under mild conditions CC thus assays may be carried out without subjecting the test specimen to thus assays may be carried out without subjecting the test specimen to CC harsh conditions. The oligomer contains an inverted polarity region CC formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3'positions of xylose sugars linked via the o-CC xylene ring). Two nucleotides are coupled through a xylene residue to cligomer stable to nuclease activity. The oligomer is able to inhibit CC gene expression, as verified by in vitros systems. Sequence containing this oligonucleotide encodes tPA-like polypeptides displaying the amino acid sequence of tPA in which 1-6 tripeptides are replaced by thr tripeptide RGD (=Arg-Gly-Asp). The produced polypeptides have plasminogen activator activity and can be used in fibrinolytic therapy, eg after cardiac infarct. They have increased blood clot specificity, longer half life, reduced inhibitor binding and/or greater proteolytic activity. See also AAQ03754-Q03771 and DE 3830734. (Updated

25-MAR-2003
16-MAY-1992
                                 -FMDV sequence and subjected to exonuclease II digestion to remove sequences encoding the 39 N- terminal amino acids from the IBRV gIII gene. The final plasmid obtained has the sequences for bGH-FMDV whih cabe expressed from the IBRV gIII promoter. When the Pst1 to Mlul region AAQ21592 is transferred into the pLA(GIII):30 dl HindIII/Hpal oligo 171/172 cassette, the bGH-FMDV sequence will be in the same reading frast the GIII protein. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                 insertion into the NCOI site of the IBRV gIII gene-contg. plasmid pLA(GIII):30 dl. Hind III/Hapl (see AAQ21591). The cassette was designed to provide cloning sites, optimal translation start signals for the bovine growth hormone (bGH) signal sequence, the RMDV epitope sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         on 25-MAR-2003 to correct PD field.)
                                                                                                                          and restriction nuclease sites to permit unidiretional nulease digestion into the IBRV gene. The resulting plasmid was then transformed with a bGH

                                                                                                                                                                                          The sequences given in AAT40331-32 represent sequences that were as substrate molecules in experiments for selection of improved catalytic activity of ribozymes. The evolution experiment spanned 10 successive generations and catalytic activity was deduced after each generation. The self-splicing group I intron of the invention is based on the large ribosomal RNA precursor from Tetrahymena thermophila. The biological function of this molecule is to catalyse its own excision from precursor rRNA to produce mature rRNA. The Tetrahymena wild type sequence was used in the design of the enzymatic RNA molecules of the invention. A number of mutations are listed in the specification which improve the enzymatic properties of this molecule, e.g. G444A, G191U, U190A and A314G. The modified enzymatic may be used as medical or pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic RNA molecules having one or more point mutation(s) - the enzymatic performance of the molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Јоусе

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAT40327-30 represent sequences that were used to CC optimise DNA cleavage activity of the enzymatic RNA molecule of the CC invention. The 3' potion of the substrate was transferred to the 3' CC terminal G of the ribozyme and amplification was performed. The product CC of the reaction was a molecule which contained the 3' portion of the CC substrate attached to the 3' end of the ribozyme. Selection occured when CC a primer was hybridised across the ligation junction and used to initiate CC and thus led to selective amplification of the catalytically active CC RNA's. The self-splicing group I intron of the catalytically active CC arge ribosomal RNA precursor from Tetrahymena thermophila. The CC large ribosomal RNA precursor from Tetrahymena thermophila. The CC large ribosomal RNA produce mature rRNA. The Tetrahymena wild type sequence CC was used in the design of the enzymatic RNA molecules of the invention. A CC number of mutations are listed in the specification which improve the CC enzymatic properties of this molecule, e.g. G44AA, G191U, U190A and CC natally agents for use in anti-viral agents, food products, creament are readucts for use in anti-viral agents, food products,

First strand cDNA synthesis from seedling leaf mRNA and PCR amplification have been performed using intron flanking primers. Primers AAT37489-90 are used in the first amplification in a nested PCR strategy for identification of intron-5, and this primer and primer AAT37492 are used in the second amplification. Cloned PCR products have been sequenced using vector-specific and insert-specific primers, to identify introns and exons. Primers corresponding to conserved regions in the protein may be used to identify other resistance genes in plants. The RPP5 gene may

which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human AI adenosine receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby

A method for treating airway disease in a subject has been produced

                                                                                                                                                                                         The present sequence represents a construction oligonucleotide for ECEPO section 2 as part of the assembly of human exythropoietin (EPO), used in an example from the present invention. The present invention describes recombinant human EPO which causes bone marrow cells to increase production of reticulocytes or red blood cells, where the polypeptide is the product of expression in CHO (Chinese hamster ovary) cells of an exogenous DNA sequence encoding human EPO. EPO is potentially useful in the diagnosis and treatment of blood disorders characterised by low or defective red blood cell production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               reactive airways
                                                                                                                                                                                                                                                                                                                                               Recombinant human erythropoietin - potentially useful for diagnosis and treatment of blood disorders.
                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1998-261957/24

                                                                                                                                                                               This sequence is a substrate for a wild type tetrahymena ribozyme L-21 CC form. The ribozyme sequence is an example of a catalytic RNA (I) of the CC invention, which catalyses site-specific cleavage of nucleic acid under CC physiological conditions includes a sequence derived from a group I CC intron. Similar catalytic RNAs (II) which catalyse hydrolysis of amide CC ends are useful as peptidases and proteases, e.g. in wound debridement, CC clot dissolution, in detergents or as a meat tenderiser. (I) cleave CC single- and (partly) double-stranded nucleic acids in vitro or in vivo, CC and are potentially useful as antiviral agents and gene regulators; also CC to generate defective but still immunogenic viruses (for vaccines); CC diagnostically to detect mutations in nucleic acid or to identify nucleic CC acid binding agents; to modulate/terminate reactions initiated by DNA CC therapeutic/diagnostic processes using antisense sequences; in DNA CC therapeutic/diagnostic processes that provide better catalytic performance; CC in vitro evolution processes that provide better catalytic performance; CC consideriation in temperature and pH ranges; new enzymatic activities or constitutions.
                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claimed PCR primers (see AAT99462-T99531) hybridise to sequences that encode the extracellular domain of human heat-stable toxin (ST) receptor protein (see AAM33371), a highly specific marker for metastasised colorectal cancer cells. PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99526 and AAT99527. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST receptor protein is being expressed by cells in the sample. Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor cDNA or mRNA (see also
                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           using primers that AAT97229)

The method comprises transformation of HPC with an SV40 viral large T-antigen gene with deleted replication initiation point. The immortalized HPC can be used in a screening method for a hair growth agent, by culture of immortalized HPC in the presence of a substance to be tested and observation of the growth of the immortalized HPC. HPC is also used in development of hair growth stimulating agents. The resent sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the course of the sequence represents a PCR primer, which is used in the sequence of the sequence represents a PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immortalised human hair papila cells used for evaluation of hair growth agent - are prepared by transformation of human hair papila cells with gene with deleted replication initiation point.

The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those essociated with impaired respiration and inflammation, including lung CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, CC acute asthma, allergies, asthma, impeded respiration, respiratory clistress syndrome, pain, cystic fibrosis, pulmonary hypertension, CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary conditions are those such as leukemias, lymphomas, carcinomas e.g. Cc colon cancer, breast cancer, lung cancer, menanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

identification of agents that reduce receptor activation, rather than compounds that antagonise the normal ligand. Once identified, (inverse) agonists can be used to study OR function. The method does not require knowledge of the endogenous receptor ligand or receptor function, and identifies directly compounds that inhibit the activated receptor, i.e. able to block both ligand-dependent and -independent activation, rather than only the ligand-dependent process, as is the case with compounds identified by ligand-dependent assays. It should accelerate drug discovery at a wide range of OR and since activated receptors have a greater response to the agents, potential drugs are more likely to be
                                                                                                                                                                                                                                                                                                                                                                              GPR3. The invention relates to a method for the identification of candidate compounds as agonists, including inverse or partial, of an orphan receptor (OR), which comprises: (i) applying test compound to constitutively active OR; and (ii) measuring its effect on OR. The method is particularly used to identify inverse agonists of G protein-coupled OR, i.e. potential therapeutic agents for treating conditions in which constitutively active OR are implicated (e.g. Graves disease, thyroid adenoma, hypertension, cardiomyopathy, schizophrenia, major depression, Kaposi's sarcoma and many others tabulated). It is based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             constitutively active receptor - particularly therapeutically active inverse agonists at G protein coupled receptors, without requiring knowledge of endogenous ligand or receptor function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a primer for DNA encoding the oirphan receptor homologue GPR3. The invention relates to a method for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          72; 114pp; English.

Identifying agonists of orphan receptors from their effect on

Analysis of DNA present in urine that has crossed the kidney barrier useful in the determination of foetal sex, and in the diagnosis of

inherited

disease,

cancer and pathogenic infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; altergic disease; bronchoconstriction; inhibitor; antinflammatory; antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hyperiension; chronic obstructive pulmonary disease; COPD;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method has been developed for the analysis of a fragment of foetal DN that has crossed the placental and kidney barriers. The method comprise assaying for presence of foetal DNA in a urine sample from a pregnant subject. Also described are: (1) detecting any target nucleic acid sequences in a urine sample; (2) diagnosis for male foetal DNA in maternal urine; and (3) general method for detecting Y Chromosomespecific nucleic acids using the primers given in AAX00055 to AAX00058. The methods are used: (1) to determine the sex of a foetus (by detectin respecific fragments); (11) for diagnosing or monitoring diseases,
                                                                                                                                                                                                                 New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           particularly cancer and infections, also pre-natal diagnosis of inherited diseases and predisposition to disease; or (iii) to establish paternity. Analysis of urinary DNA is non-invasive and provides early indication of

CC nucleic acids involved in bronchoconstriction, allergies, and/or CC inflammation. The ON can have antiinflammatory, antiallergic, CC inflammation. The ON can have antiinflammatory, antiallergic, antiiasthmatic, cytostatic and analgesic activities. The compositions are CC useful for the treatment of diseases associated with inflammation, CC impaired airways, including lung disease and diseases whose secondary CC effects afflict the lungs of a subject. They can be used for treating CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, CC carcinomas, and cancers which may metastasise to the lungs, including CC breast and prostate cancer. The reduction of the adenosine content of the CC onstruction and inflammation. AAA32313 to AAA3312 represent the CC nucleotide sequences given in the sequence listing from the present content of invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 equences are also called SEQ ID NO:1 to 185, but the sequences differ CC CAAA3392) are specifically claimed ONs from the present invention on N.B. Sequences given in the disclosure of the present invention do not match CC up with their corresponding SEQ ID NO: sequences given in the sequence given in the sequence of the present invention of the sequence content of the content of the content of the present invention of the sequence of the present invention of the sequence content of the content

New polynucleotide homologous with a portion of one strand of the human FEZ1 gene, useful for alleviating abnormal cell proliferation such as

Example 1; Page 45; 255pp; English

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC pCR primers AAA64521-22 were used to amplify a fragment of the human FEZ1 CC gene. FEZ1 is a tumour suppressor gene, located at chromosome location CC 8p22. Decreased or no expression of FEZ1 is detected in a variety of CC cancer cells. Expression of FEZ1 inhibits tumour growth and CC with protein FEZ1 also interacts with tubulin, with microtubules, and CC with protein FEZ1 also interacts with tubulin, with microtubules, and CC dephosphorylation modulates the effect of the FEZ1 protein. Inhibitors of FEZ1 gene expression are useful for inducing cells to proliferate. CC compounds which modulate FEZ1 association with tubulin are useful for CC alleviating tubulin hyper- or hypo- polymerisation disorders, such as those associated with aberrant initiation of mitosis, modulation of the CC initiation and rate of cell proliferation and cell growth, modulation of CC cell shape, cell rigidity, cell motility, rate and stage of cellular DNA CC replication, intracellular distribution of organelles, metastatic CC cancerous phenotype. Compounds which modulate FEZ1 binding and CC cancerous phenotype. Compounds which modulate FEZ1 binding and CC phosphorylation are also useful for alleviating a disorder, such as CC tumorigenesis, tumour survival, growth and metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Loc

(II) is an adenosine AZa receptor agonist (IA), or an oligonuclectide (IB), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Jb), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or

cc expression and or activity of target polypeptides associated with cc lung/respiratory disorders and malignancies, such as stimulating and citivating peptide factors and transmitters, transcription factors, cimmunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, communoglobulins and antibodies, antibody receptors, cytokines and commonkine receptors, adenosine receptors, binding proteins, adenosine receptors, brokens expected common receptors, cytokine and compressed system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vascative peptides and creceptors, binding proteins and malignancy associated proteins. The contisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(ies) and/or and/or lung inflammation, allergy(ies) and/or condition selected from pulmonary vasoconstriction, inflammation, condition selected from pulmonary vasoconstriction, bronchitis, condition selected from pulmonary vasoconstriction, bronchitis, condition selected from pulmonary vasoconstriction, pulmonary infections, bronchitis, condition cancer. AAF18434 to AAF21543 represent human polynucleotide condition of the present invention.

(AREN-) ARENA PHARM

WPI; 2000-317935/27.

Identifying compounds with inverse agonist activity to orphan receptors useful for treating e.g. Graves' disease, and schizophrenia, involves contacting candidate compounds with constitutively activated receptors.

4. Page 73; 110pp; English

The present invention describes a method for directly identifying

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         agonist activity to a constitutively active orphan receptor (ORR). The method comprises determining the efficacy of the compound by contacting it with the ORR. A compound identified by the above method having inverse agonist activity to ORR is useful for the treatment of diseases characterised by constitutive activation of the receptor e.g. Graves' disease, male precocious puberty, Jansen's disease, retinitis pigmentosa, hypoparathyroidism, neuropsychiatric diseases, schizophrenia, major depression, and cancerous growth in Kaposi's sarcoma. The method can identify (I) directly without prior knowledge or use of receptor ligands and is useful for accelerating drug discovery at a broad range of ORR. The present sequence represents a reverse transcriptase PCR primer for the human orphan receptor GFR12, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; G-protein coupled receptor 12; GPCR12; cardiomyopathy; vaccine; atherosclerosis; diabetes; cardiant; cytostatic; cancer; obesity; pain; diabetes mellitus; anorexia; cachexia; cardiomyopathy; atherosclerosis; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorders; retinal disorder; HIV;

                                                                                                                                                                                                                                                                                                                                                                                      RESULT 2879
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are neeful for determining the presence, absence or CC oligonucleotides are neeful for determining the presence, absence or CC didnitity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic traits include disease e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune CC disease, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                     Query Match

The eIF-5A coding sequence, when introduced into a plant cell in reverse orientation, inhibits expression of the endogenous eIF-5A gene. The eIF-5A coding sequences are useful for altering age-related senescence and/or environmental stress-related senescence, for inhibiting seed aging and for increasing seed yield in a plant. In addition, the inhibition of senescence in a plant results in increased resistance of the plant to environmental stress-induced and/or pathogen-induced senescence, increased plant blomass, delayed fruit softening and spoilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tomato, Arabidopsis and carnation cDNA clones encoding senescence-induced deoxyhypusine synthase and eIF-5a, useful for inhibiting senescence in a plant when introduced in reverse orientation into the genome of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-JUL-1999; 99US-00348675.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cd designed to target different regions of the human MEXXI RMA, and were CC analysed for their effect on MEXXI mRNA levels by quantitative real-time CC pcr. GAPDH (glyceraldehyde-3-phosphate) mRNA levels were measured as a CC control. MEXXI (also known as mitogen-activated protein kinase kinase and CC control. MEXXI (also known as mitogen-activated protein kinase kinase cC kinase 1, MEX kinase 1 and MAP/EEK kinase kinase 1) is a dual-specific control. MEXXI (also known as mitogen-activated protein kinase kinase cC control threonine kinase which mediates cellular responses to mitogenic control to the distribution of control of kinase kinase/stress-cC activated protein kinase) MAP kinase cascades. MEXXI regulates signalling control of which have been associated with the development of control of which have been associated with the development of control of my control of MF-kappa-B, mediated transcription cc directly downstream of BCl-2 in an apoptotic signalling cascade, and cc plays a critical role in the control of MF-kappa-B-mediated transcription cc invention are useful for diagnosis, prevention and treatment of conditions associated with MEXXI expression, such as inflammation, and cc cancer and other hyperproliferative disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     agents using G-protein coupled receptor (GPCR) polypeptide which promotes insulin secretion by pancreas beta-cells under high glucose levels, and increases intracellular cyclic adenosine monophosphate (cAMP concentration. Also included are (1) screening method of cells transformed by a vector containing a gene encoding the GPCR polypeptide; (2) antidiabetic agents identified by the screening method; (3) drug compositions containing these compounds; and (4) treatment of diabetes using these drug compositions. The present sequence is a 5 RACE (rapid amplification of cDNA ends) PCR primer used to isolate the human cDNA amplification of cDNA ends) PCR primer used to isolate the human cDNA
                                      Increasing resistance to physiological disease in plant, by integrating gene or its fragment encoding senescence-induced deoxyhypusine synthase or eIF5A in antisense orientation into plant genome and growing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC in a plant, involving integrating into the plant genome a vector having CC antisense sequences complementary to corresponding portion of one strand CC of DNA encoding endogenous senescence-induced eIF-5A (eukaryotic initiation factor 5A) gene or 3' end of endogenous senescence-induced CC deoxyhypusine synthase (DHS), a portion of RNA sequence encoded by eIF-5A CC gene or DHS gene, and growing the plant. Also included is a plant or its CC progeny, where the plant is derived from a cell having inhibited or CC reduced expression of senescence-induced DHS, senescence-induced eIF-5A, CC or both, where the cell is produced by the method of the invention. The CC method is useful for increasing resistance to physiological disease such as blossom end rot in a plant. The method results in delayed onset of senescence and improved resistance to environmental stress and pathogens, CC thus extending the plant shelf-life and/or growth period. The method CC delays deterioration and spoilage of perishable fruits, flowers, vegetables, and plants, increases the shelf-life of perishable fruits, flowers, tolerant and pathogen resistant. The present sequence is a PCR primer collect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

GPCRX polypeptides are confectively receptor and date substance or ligand molecules interacting with an colfactory receptor polypeptide. The polypeptide, [1] and [1] are also consistent for treating diseases and disorders related to cell signal consistent diseases, taste and scent developmental diseases, immune cc diseases, taste and scent detectability disorders, Burkitt's lymphoma, cc corticomeurogenic disease, signal transduction pathway disorders, cc corticomeurogenic disease, signal transduction pathway disorders, cc corticomeurogenic disease, signal transduction pathway disorders, cc diseases, taste and scent detectability disorders, Burkitt's lymphoma, cc diseases, transplantation, cancer, parkinson's disease, acute cheart failure, urinary retention, osteoporosis, Crohn's disease, ulcers, cc allergies, neurological disorders, genetic disorders, transplantation, cf trility, pancreatitis, Hyperthyroldism and Endometriosis. GPCRX csequences are also useful for identifying acell or tissue type in a biological sample, to amplify DNA sequences from very small biological samples such as tissues e.g. hair or skin or body fluids in forensic control of continuing and/or activity of GPCRX protein and for identifying and/or evaluating modulators of GPCRX protein and for identifying and/or evaluating modulators of GPCRX protein and for detect DNA encoding a convert grant compled receptor produced from real time quantative (RTQ) cc -PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESERVATION OF THE STATE OF THE

CC (PCR) for amplifying a gene that is altered in a particular cancer. The content of comprises expanding copies of a gene by amplification method and CC using the product in a second methylation-specific amplification to detect gene inactivation. The method is useful for amplifying the gene CC cancers which include head and neck, leukaemia, colorectal, prostate and CC bladder) thereby permitting cancer detection and monitoring by detecting GC gene inactivation in biological fluid such as sputum and blood. The method finds application in the area of chemoprevention, where markers GC are needed to identify high-risk subjects and to evaluate efficacy of CC preventive agents. The method is further useful for identifying cincer this premailgnant state, and for monitoring the efficacy of the interventions, by determining whether the previously detected methylation CC biomarker persists or disappears during the course of the interventions, which include immunological modulation, antisense treatment, gene therapy CC and alkylating treatments. The method is useful for detecting the CC aberrant methylguanine DNA methyltransferase gene (MGMT), RASSFIA) gene or other gene promoters. The present sequence is CC acceptable or amplifying RASSFIA gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nested, two-stage polymerase chain reaction for amplifying gene in cancer e.g. of lung, comprises expanding copies of gene by amplification method and using the product in a second amplification to detect gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to identifying a toxicologically relevant canine gene and the generation of an array of toxicologically relevant canine genes. The gene array is useful for obtaining a gene expression profile, by exposing a population of cells to an agent, obtaining cDNA from the population of cells, labeling the cDNA, and contacting the cDNA with the gene array. The relevant gene is useful for making and using arrays to determine toxicological responses to various agents, and also useful for identifying novel gene sequences and novel canine genes. The method for analysing toxicological responses using the canine gene array is rapid and efficient. The present sequence is related to the canine gene array
                                                                                                                                                                                                                                                                   Al thyroid disease; atrophic gastritis; pernicious anaemia; Chron's disease; colltis ulcerosa; Goodpasture syndrome; IgA nephropathy; IgG glomerulonephritis; myasthenia gravis; partial lipodystrophy; polymyositis; primary biliary cirrhosis; primary sclerosing cholangitis;

The invention relates to nucleic acids which encode novel polypeptides CC having transglutaminase activity. The compositions of polypeptide are useful for transamidation reactions on peptides and polypeptides. CC useful for transamidation reactions on peptides and polypeptides. CC in a diagnostic method in a subject or in cells derived from a subject CC having an autoimmune disease. The method for detecting transglutaminase proteins may be used to diagnose autoimmune diseases which include proteins may be used to diagnose autoimmune diseases which include cc hyroid disease, AI haemolytic anaemia, AI thrombocytopenic purpara, AI convoid diseases, atrophic gastritis, pernicious anaemia, Chron's CC disease, colitis ulcerosa, Goodpasture syndrome, Igh nephropathy or IgG colymoratitis, primary biliary cirrhosis, primary sclerosing cholangitis, cpolymositis, primary biliary cirrhosis, primary sclerosing cholangitis, cpolymositis, rheumatoid arthritis, rheumatism, sarcoidosis, Sjogren's syndrome, SLE, splenic atrophy, type I (insulin-dependent) diabetes complities, Wegener granulomatosis, ulcerative colitis, vascuiltis (both systemic and cutaneous) and vitiligo. This sequence represents a primer cused in the study of transglutaminase genes in which DNA, amino acid constances and chromosomal locations of novel transglutaminases are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            constant airway dysfunction and a second active agant comprising an control and all airway dysfunction and a second active agant comprising an control and uniquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, control and cytostatic activity. The composition may have a service in antisense gene therapy. The composition is useful for treating or contenting a respiratory, lung or malignant disease or condition, also control of an antiinflammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine control of the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO are format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Local Similarity Matches 18; Conser

The invention describes a method of monitoring (M) transplanted material containing providing a urine sample suspected of containing nucleic acid of the transplanted material, where the transplanted containing containing the urine sample for nucleic acids from the cell genome of the transplanted contained contained that are different from nucleic acids of the transplanted contained that that are different from nucleic acids of the transplanted contained that the transplanted nucleic acids as well as nucleic acid modifications and contain composed the kidney barrier. (M) is useful for detecting the presence of specific nucleic acids as well as nucleic acid modifications and contain composed the transplanted contained nucleotides, for diagnosis of diseases such as cancer, diabetes, arteriosclerosis, beesity and various autoimmune diseases or chromosomal containing that transplanted contains and pathogen infections, for containing contains to various diseases, for monitoring cancer treatment, for analysing specific nucleic acids in urine to track the success of transplanted cells, tissue and organs, for determination of foetus sex and the identification of foetal genetic diseases, such as those inherited from the father for various purposes, including containing DNA modifications accompanied by death of at least one subset of the cells bearing DNA modification. (M) is a safe, and simple non-invasive test, an excellent alternative to capacific DYZ1 sequence

                                                                                                                                                  The present sequence is that of an oligonucleotide used in a method CC designed to rapidly array and normalize a complex cDNA library obtained CC from a target species. Clones are arrayed into multi-well plates. Each CC well contains 16 oligonucleotides with a 5' polylinker, a poly-T run CC which allows an anchored oligonucleotide in each well to selectively CC which allows an anchored oligonucleotide in each well to selectively CC unique 3' key sequences are designed to give a comprehensive level of CC degeneracy since they are diverse and numerous enough to ensure that CC every possible cDNA sequence can be bound by an individual, specific CC oligonucleotide in a single well. The cDNA library is heated to denature CC the clones into single stranded DNA, and an aliquot is added to every common 5' region present in every cDNA clone serves as the 5' priming CC well. The anchored oligonucleotide serves as the 3' primer in PCR, and CC site. Denaturing and washing leave anchored cDNA in each well. The CC and isolate clones encoding 6-protein coupled receptors, especially CC pathway of invertebrates and vertebrates, e.g. odourant binding proteins, CC or other olfactory or neuronal proteins. The identified receptors and crive effectors involved in the olfactory capanimal's sensitivity to odours, for manufacturing compounds or devices that mask odours, or trapping invertebrates with odourants.

CC semicochemicals (e.g. arometics or pheromone mimetics) can be developed controlling insect feeding and breeding behaviour, detecting the presence of small air-borne molecules, etc

The present invention describes an RNA-binding motif protein-15 (RBM15)-CC megakaryoblastic leukaemia-1 (MKL1) fusion protein, a MKL1-RBM15-S fusion protein, a mKL1-RBM15-S fusion protein, and a MKL1-RBM15-S+AE fusion protein associated with acute proteins associated leukaemia (AMKL). Also described: (1) an antibody that specifically binds to the RBM15-MKL1, MKL1-RBM15-S, or MKL1-RBM15-S+AE CC fusion protein; (2) a non-human transgenic animal that has been altered to express a gene encoding a RBM15-MKL1, MKL1-RBM15-S, or MKL1-RBM15-S+AE CC fusion protein; (3) identifying an agent capable of binding to a RBM15-CC MKL1, MKL1-RBM15-S, or MKL1-RBM15-S+AE fusion protein; (4) detecting the t(1;22) chromosomal rearrangement associated with AMKL; and (5) screening CC protein arising from the t(1;22) chromosomal rearrangement associated with AMKL; and (5) screening CC with AMKL. The fusion proteins have cytostatic activity of a fusion CC proteins and nucleotide molecules are useful for designing and preparing agents that specifically inhibit the expression of the RBM15-S+AE fusion CC proteins and nucleotide molecules are useful for designing and preparing CC asymmet that specifically inhibit the expression of the RBM15-MKL1 or MKL1-RBM15 genes in cells for therapeutic and other purposes. The transgenic CC canimals are useful for identifying and testing carcinogenic or therapeutic compositions. The methods are also useful for attenting the t(1;22) chromosomal rearrangement associated with AMKL, or for identifying agents useful for treating patients with AMKL. The antibodies CC can be used to selectively, kill cells expressing RBM15-MKL1, MKL1-RBM15-S+AE fusion protein. RBM15 is located to chromosome 1 pagents and preparity of a fusion of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New RNA-binding motif protein-15 (RBM15)-megakaryoblastic leukemia-1 (MKL1), MKL1-RBM15-S and MKL1-RBM15-S+AE fusion proteins, useful for identifying agents useful for treating patients with acute megakaryoblastic leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MKL1;

                                                                                                                                                                           CC deposited at the UK National Collection of Type Cultures under number CC 11740. Also described: (1) selecting an agent for treating a Mycoplasma CC infection in a subject by assaying a sample from the subject for CC Mycoplasma spp A39, and if the assay is positive, selecting as an agent CC enalogue or derivative; (2) an oligonucleotide probe which is capable of Mybridising to a region of polynucleotide from Mycoplasma spp A39 and if the assay is positive, selecting as an agent CC corresponding region from another Mycoplasma; (3) an oligonucleotide probe which is capable of Mybridising to a polynucleotide or corresponding region from another Mycoplasma; (3) an oligonucleotide or corresponding region from another Mycoplasma; (3) an oligonucleotide corresponding region from another Mycoplasma; (3) an oligonucleotide corresponding for Mycoplasma spp A39 and incapable of amplifying a sequence cof the same length on the target sequence from another Mycoplasma; and CC (4) assaying for Mycoplasma spp A39 and incapable of amplifying a sequence cof the same length on the target sequence from another Mycoplasma; and CC (4) assaying for Mycoplasma spp A39 by obtaining a sample potentially containing a sample potentially containing a sample potentially containing the length of the 16S-23S (bp). The Mycoplasma spp A39 or its component can be used as a control in an assay of a sample potentially containing Mycoplasma spp A30. Compounds Compositions for the treatment of a human subject with Mycoplasma spp A39. Compounds composition for the subject is capable of production of an antibiotic composition of an assay for Mycoplasma spp A39 or its component, and the CC compound comprises a pleuromatalin consisting of valuemalin or its compound comprises a pleuromatalin consisting of valuemalin or its component or or derivative. The present sequence represents a PCR primer for the 16S rDNA region of Mycoplasma spp A39, which is given in the

New antisense oligonucleotides targeted to nucleic acids encoding src-c, useful for diagnosing, treating or preventing diseases associated with the expression of src-c, e.g. cancer or inflammation, and in research

Example 13; Page 85; 137pp; English

The present invention describes a compound (I) that is 8-50 nucleobases CC in length targeted to a nucleic acid molecule encoding a 5'UTR, 3'UTR, CC coding region, intron region, exon region, stop codon, intron:exon function, exon:exon junction, or 5' mRNA variant of src-c, and which cc specifically hybridises with and inhibits the expression of src-c. (I) cc have cytostatic, antiinflammatory, osteopathic and antibacterial cc artivities, and can be used in antisense therapy and in vaccines. The cc antisense compounds (I) can be used for modulating the expression of src-c c and for treating diseases or conditions associated with expression of CC c and for treating diseases or conditions associated with expression of CC src-c, e.g. aberrant bone remodeling or hyperproliferative disorders, CC particularly cancer, such as breast cancer, neuroblastoma, retinoblastoma cancer, ovarian cancer, oesophageal cancer, neuroblastoma, retinoblastoma cor Kaposi's sarcoma. (I) are also useful for diagnostics, therapeutics, Crophylaxis, e.g. to prevent or delay infection, inflammation or tumour continuous of various members of a biological pathway. The present continuous represents a probe for mouse src-c, which is used in an example of from the present invention. sequence represents a probe from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 2894
ABX79809/c
                                                                                                                                                       repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep.X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABT95676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

The binding protein and its coding sequence are useful for the diagnosis and treatment of cancer. The present sequence is a PCR primer, which was used in an example from the invention
                                      The invention relates to a novel polypeptide, argininoacyl tRNA synthetase 12.87, and the polypucleotide encoding it. The polypeptide is useful for treating various diseases, such as malignant tumours, inflammations, immunological diseases, haemopathy and human immunodeficiency virus (HIV) infection. The invention also discloses the antagonist resisting the polypeptide and its treatment effect, and application of the polymucleotide. The present sequence represents a PCR primer used to amplify the argininoacyl tRNA synthetase 12.87 gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insulin-like growth factor binding protein 16.17 and encoding
polynucleotide, used in diagnosis and treatment of cancer.

                                                                                                                           molecules, which comprise human UGT2B sequence polymorphisms (see AR295051-295110). Probes which detect the UGT2B locus polymorphisms can be used to detect altered UGT2B metabolism of a substrate in an individual. The nucleic acid molecules comprising a human UGT2B sequence polymorphism can be used in screening assays for genotyping individuals, also to predict their rate of metabolism of UGT2B substrate, potential drug-drug interactions and adverse side effects. The polymorphisms can be used as single nucleotide polymorphisms (SNPs) for detecting genetic linkage related to phenotypic variation in activity or expression of UGT2B protein. The polymorphism containing nucleic acid molecules may also be used for generating genetically modified non-human animals and for obtaining site specific gene modification in cell lines
                                                                                                                                                                                                                                                                                                                                 This sequence represents a primer used to sequence polymorphic fragments of the human UDP-glucuronosyltransferase 287 (UGT287) gene. UDP-glucuronosyltransferase 287 (UGT287) gene. UDP-glucuronosyltransferases (UGT8) are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates. The UGT28 gene subfamily encode steroid metabolizing isoforms in the liver. Alteration of the expression or function of UGTs may effect drug metabolism. The invention relates to non-chromosomal nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human UDP-glucuronosyltransferase sequence, polymorphisms for genotyping individuals to predict rate of metabolism of substrates for identifying potential drug interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               UDP-glucuronosyltransferase 2B7; UGT2B7; polymorphism; metabolism; SNPs;

                                                                                                                                                                                                                                                                                                                        glucuronidated drug that may be used in treating cancer patients. It is also useful in determining persons at risk for epirubicin toxicity, in reducing or eliminating side effects associated with epirubicin treatment, and in ways of increasing the efficacy of dosage regimens. The present sequence is a primer used for sequencing human UGT2B7 DNA

                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an UDP-glucoronosyl transferase (UGP) enzyme, UG72B7. The invention also relates to compositions and methods for optimising UG72B7 substrate dosings and for predicting UG72B7 substrate toxicity. The method is useful in determining the dose of a UG72B7-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primer is two or three nucleotides, and the template and primer do not form a stable duplex in solution in the absence of the MCV NSSB protein. The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and cefficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NS5B-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation or chain termination. Specifically, the short RNA template and primer pairs are useful in Screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NS5B replication and ultimately in the development of inhibitors of NS5B newly identified inhibitors of replicase activity may be used for developing anti-HCV pharmaceuticals. Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The present invention also discloses applying the polypeptide in treating various diseases, such as malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The present invention also discloses application of the polymucleotides encoding human shear protein 8.91. The present sequence is a reverse transcriptase (RT)-PCR primer used to isolate nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human shear protein 8.91 polypeptide for treating malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 24 BP; 3

The specification describes a method for determining whether a product a gene is involved in preventing a replication error in a cell. The method comprises providing the cell with a specific inhibitor for the product and determining the level of functional expression of a marker gene in the cell, where the level of expression of the marker gene is dependent on the occurrence of the replication error. The method is use for determining whether a product of a gene is involved in preventing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a PCR primer used to isolate DN human Nck associated protein 1 (Wap1) of the invention. apoptosis. The protein can be used in the investigation, treatment (e.g. by gene therapy) of Alzheimer's disease
                                                                                                                                                                                                                           Determining whether a product of a gene is involved in preventing a replication error in a cell comprises providing a specific inhibitor the product and determining the level of expression of a marker gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein inhibiting apoptosis, useful in Alzheimer's disease.

                                       Sequence
                                                                    This invention relates to the goat beta-casein gene, represented by AAF77439. There are 18 positions in the 5'-flanking region, 21 positions in intron sequences and 1 position in exon VII that conflict with the sequence reported for this gene by Roberts et al (1992). The present sequence represents a fragment of the casein gene in which a conflict occurs when compared to the Roberts et al (1992) sequence for the same

                                                                                                                                                                                                                                                                                                                                                        This sequence represents a molecular scaffold which may be used in a composition of matter comprising multiple fluorophores. The fluorophores are bound to the molecular scaffold at separate predetermined positions, to permit fluorescence energy transfer between two fluorophores. The fluorophores are characterized by maximum emission wavelength of one being greater than the minimum excitation wavelength of the other. The composition is useful for determining whether a preselected nucleotide residue is present at a predetermined position within a nucleic acid. It is also useful in multicomponent analysis including multiplex biological analysis, and identifying multiple single nucleotide polymorphisms. The presence of a number of given nucleotide residues is determined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Composition of matter useful for multi-component analyses, comprises multiple fluorophores bound to molecular scaffold at preset positions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-SEP-2000;

```
The present invention relates to the isolation of a novel cytokine, CC zalphall Ligand and the polynucleotide encoding it. The invention also CC gives the sequence for the zalphall receptor and the polynucleotide encoding it. The zalphall rigand polypeptide stimulates proliferation of CC entural killer (NK) cells or NK cell progenitors, the activation of NK CC cells, proliferation of T-cells, proliferation of B-cells stimulates an antibodies response in a mammal, and CC reduces proliferation of B-cells stimulates an antibodies. The zalphall Ligand polypeptide is also useful in preparing antibodies that CC bind to zalphall Ligand epitopes. The zalphall Ligand golypeptide is also useful in preparing antibodies that CC inhibitors of its activity, to enhance the generation of anti-tumour CC inhibitors of its activity, to enhance the generation of anti-tumour CC responses with or without the infusion of donor lymphocytes, and to CC activate or stimulate the immune system. The present sequence represents CC human zalphall Ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-MAR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a purified polypeptide or its fragment derived from the LS147 gene capable of selectively hybridising to the nucleic acid of the gene and has at least 50% identity with the polymucleotide. The LS147 polypeptide is useful for preparing a composition for treating cancer, e.g. lung cancer using gene therapy. This sequence represents a universal primer used to sequence LS147 expressed sequence tag (EST)-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for analysing a target nucleic acid consisting of repetitive and non-repetitive sequences. The method comprises hybridising a polynucleotide probe comprising a segment complementary to an adjacent repetitive region, where the second segment consists of a defined number of repeats, and determining the melting point temperature of the hybrid. The method is used to analyse microsatellites, especially microsatellite instability, particularly as a means for detecting hereditary tumours. Alternatively, the method is used to identify an individual in a population. The present sequence is a probe for hypertical repeat locus BAT25, and was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide-nanoparticle probe; dia nucleic acid detection; nanostructure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 16;
